1 2D QUAD ROTOR DYNAMICS

In this section I will calculate the dynamic equations for the 2D simplified version of a quad rotor.

1.1 STATE VARIABLES

We will have our $\xi = (q[t], u[t])$

$$Q = [X, Z, \Theta]$$
: with respect to world frame $U = [U1, U2] = [F1, F2]$ with respect to the body frame

1.2 CALCULATING THE LAGRANGE

$$T = \frac{1}{2}m(\dot{x}^2 + \dot{z}^2) + \frac{1}{2}I_{ZZ}\dot{\theta}^2 (K.E)$$

$$V = mgZ \quad (P.E.)$$

$$\therefore L = T - V \quad (LAGRANGE)$$

$$= \frac{1}{2}m(\dot{x}^2 + z^2) + \frac{1}{2}I_{ZZ}\dot{\theta}^2 - mgZ$$

1.3 CALCULATING THE EULER-LAGRANGE EQUATIONS

EQ. OF MOTION
$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}} \right) - \left(\frac{\partial L}{\partial q} \right) =
\begin{bmatrix}
F_{W} & Forces and Moments \\
M_{W} & \text{on the world frame}
\end{bmatrix}$$

As shown in Figure 1, F1 and F2 are in body coordinates. So we will need to transform it to world coordinates. We can do that by using trigonometry:

$$F_{W} = \begin{bmatrix} -F_{1}\sin\theta - F_{2}\sin\theta \\ -F_{3}\cos\theta - F_{2}\cos\theta \end{bmatrix}$$

$$M_{W} = F_{2} \cdot \underline{L} - F_{3} \cdot \underline{L}$$

$$\underline{Z}$$

Ignoring the air resistance and any drag, we get our equations of motion:

Eq. of MOTION =
$$= \begin{bmatrix} m\ddot{x} \\ m\ddot{z} - mg \\ \ddot{\theta}I_{ZZ} \end{bmatrix} = \begin{bmatrix} -F_1 & \sin\theta - F_2 & \sin\theta \\ -F_1 & \cos\theta - F_2 & \cos\theta \\ L_{/2} & (F_2 - F_1) \end{bmatrix}$$

REARENGE IF FOR:

$$M(q)\ddot{q} + C(q,\dot{q}) + G(q) + D(\dot{q}) = F$$

$$NO DRAG$$

$$\begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & Tzz \end{bmatrix} \begin{bmatrix} \ddot{x} \\ \ddot{q} \end{bmatrix} + \begin{bmatrix} 0 \\ -mq \\ 0 \end{bmatrix} = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ V_2 & (F_2 - F_1) \end{bmatrix}$$

$$NO DRAG$$

$$V = \begin{bmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & Tzz \end{bmatrix} \begin{bmatrix} \ddot{x} \\ \ddot{q} \end{bmatrix} + \begin{bmatrix} 0 \\ -mq \\ 0 \end{bmatrix} = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ V_2 & (F_2 - F_1) \end{bmatrix}$$

$$NO DRAG$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$NO DRAG$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$NO DRAG$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$NO DRAG$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$V = \begin{bmatrix} -F_1 & sin\theta - F_2 & sin\theta \\ -F_1 & cos\theta - F_2 & cos\theta \\ -F_2 & (F_2 - F_1) \end{bmatrix}$$

$$\implies M(q)\ddot{q} + G(q) = F$$

$$\implies \ddot{q} = M'(q) (F - G(q)) **$$

2 GETTING A PROJECTION

To get a projection for my system I will follow the model provided in the class notes:

$$\mathscr{P}(\bar{\xi}) = \begin{cases} \dot{x} = f(x, u) & x(0) = x_0 \\ u = \bar{u} + K(\bar{x} - x). \end{cases}$$

First we need to find a dx = f(x, u). So let's expand our state and apply the solution obtained of our dynamics.

$$X = \begin{bmatrix} 9 \\ \vdots \\ 9 \end{bmatrix} = \begin{bmatrix} x \\ z \\ \theta \\ \vdots \\ \vdots \\ \theta \end{bmatrix} = \begin{bmatrix} x \\ \vdots \end{bmatrix}$$

$$X = \begin{bmatrix} 9 \\ \vdots \\ 0 \\ \vdots \\ \vdots \\ \vdots \\ \vdots \\ 0 \end{bmatrix}$$

$$\dot{x} = \int (x_1 u) = \begin{bmatrix} \dot{q} \\ M^{-1}(q)(F - G(q)) \end{bmatrix}$$

The projection can be finalized by substituting **u** and solving the set of equations (see Mathematica code).

3 THE COST EQUATION

The cost equation will be the basic quadratic equation used through the quarter of the form:

$$\mathcal{L} = \frac{1}{2} \left(\left(x - xd \right)^T Q \left(x - xd \right) + \frac{1}{2} \left(U - Ud \right)^T R \left(U - Ud \right)$$

$$J = \int_0^T \mathcal{L} dt + \frac{1}{2} \left(x - xd \right)^T P_1 \left(x - xd \right)$$

3.1 PICKING THE CONSTANTS

For this project it is important to mention the choices that were made for each constant with the purpose of prioritizing position rather than anything else.

Q:

For this constant we give bigger weights to enforce the positions (x, z) and we reduce the weights of the other terms. It is important to reduce weight of Θ , due to the quad rotor dynamics it can only move in \mathbf{x} by tilting, for this reason by reducing this value we make the quad more likely to move in \mathbf{x} .

R:

We are going to give small weights to let the rotors apply whatever force necessary to enforce the position.

P1:

Likewise Q, we are going to enforce the position (x, z) better than the other terms.

4 THE GOAL

As mentioned in section 1 the algorithm has as objective to optimize the trajectory of a quad rotor flying in a circular movement. Therefore the following functions will be used as goal:

$$Xd(t) = \cos(3t)$$

$$Xd(t) = \frac{d}{dt}\cos(3t)$$

$$Zd(t) = \sin(3t)$$

$$Zd(t) = \frac{d}{dt}\sin(3t)$$

$$\frac{d}{dt}\sin(3t)$$

$$\frac{d}{dt}\sin(3t)$$

$$\frac{d}{dt}\cos(3t)$$

$$\frac{d}{dt}\sin(3t)$$

$$\frac{d}{dt}\sin(3t$$

F1d and **F2d** gets a small value to try to avoid being negative, what is impossible for a quad rotor since its rotors are usually not capable of generating negative thrusts.

5 ALGORITHM EXECUTION CONSIDERATIONS

The algorithm will take around five minutes to run and will provide an animation of a bar like 2D Quad rotor as well as the plots for $\{x, z, \Theta\}$. In order to try to make the execution faster I have increased the maximum error allowed to E=10, however the cost converges and given enough time (if you are patient enough) it will provide even better results than 10, probably converging to something very close to 0 eventually.
